Sri Lanka Motor Traffic Department

Chatbot Assistant

Application Specification - MVP

Purpose	A conversational assistant that helps citizens find DMT service information, understand requirements, and complete selected forms with guided assistance.
MVP Duration	1 week
Prototype	Open prototype

Prepared for MVP planning and project submission

1. Application Overview

The proposed application is a web-based chatbot assistant for the Sri Lanka Department of Motor Traffic (DMT). It provides a single conversational entry point for users who need information about selected DMT services or assistance completing supported forms. The one-week MVP is intentionally limited to a small number of high-value journeys so the team can deliver a reliable end-to-end prototype.

Target Users

- Citizens and vehicle owners seeking information about supported DMT services.
- Driving-licence applicants who need requirements and next-step guidance.
- Users who need help understanding official form fields or preparing information before using the DMT appointment process.

2. Problem Statement

Users may need to move between service instructions, downloadable forms and appointment information, while also interpreting administrative terminology. This can make it difficult to identify the correct service, understand the required documents, and complete forms correctly. The chatbot addresses this by giving users a guided path from their question to the information, form assistance and official next step they need.

3. MVP Definition

MVP Capability	Deliverable
Service identification	Understand the user's request and guide them to one of the supported DMT service journeys.
DMT information Q&A	Answer a controlled set of common questions using verified project knowledge.
Requirements checklist	Present the basic documents and information required for the selected service.
Guided form assistance	Collect selected form details step by step and explain fields in simple language.
Basic validation & review	Check required fields/basic formats and show a final summary for user correction.
Official hand-off	Direct the user to the relevant official DMT/appointment next step; no government transaction is automated.

MVP boundary: Direct appointment booking, payments, OCR/document scanning, user accounts, voice features, status tracking, analytics dashboards, and changes to official DMT records are excluded from the one-week MVP.

4. Scope, Limitations, Risks and Assumptions

Area	Definition
Scope	Chat interface, selected service journeys, controlled DMT Q&A, guided form assistance, basic validation, review summary and official hand-off.
Limitations	The assistant provides guidance only. It does not approve applications, verify DMT records, make legal/eligibility decisions, or guarantee application acceptance.
Key risks	Incorrect or outdated information; unsupported AI answers; handling of personal data; scope expansion during the one-week build.
Risk controls	Use a controlled knowledge source, restrict unsupported answers, avoid unnecessary storage of personal information, provide fallback responses, and freeze the MVP scope.
Assumptions	The team has access to the selected official information/form fields and can validate the main demo journeys during the development week.

5. Development Methodology

A lightweight Agile and rapid-prototyping approach will be used. The existing Figma prototype will guide the user experience. Development will proceed in small, testable increments, with daily review of the working flow. The priority is a stable end-to-end MVP rather than broad feature coverage.

- Freeze the selected services and form scope on Day 1.
- Build the highest-priority user journey first, then reuse components for remaining supported flows.
- Test chatbot answers and form interactions continuously.
- Resolve critical accuracy and usability issues before adding lower-priority features.

6. Initial User Stories and Priorities

Priority	User Story
P0	As a user, I want to describe the DMT service I need so that the chatbot can guide me to the correct supported process.
P0	As a user, I want to see the required documents and basic requirements for my selected service.
P0	As a user, I want the chatbot to guide me through supported form fields one by one.
P0	As a user, I want to review and correct my entered information before proceeding.
P1	As a user, I want the chatbot to clearly indicate when it cannot answer and direct me to an official source.

7. Success Measures

Measure	MVP Success Criterion
Functional completion	The complete supported journey - question, guidance, form assistance, review and hand-off - works reliably in the final MVP demonstration.
Accuracy	The chatbot correctly answers the agreed test questions for the selected DMT services and does not invent mandatory requirements.
Form usability	A test user can complete the supported guided form flow without additional explanation from the development team.
Safe fallback	Unsupported or uncertain questions receive a clear fallback/official-source direction instead of a fabricated answer.
User experience	Test users can understand the next action at each stage of the conversation.

8. Future Considerations

After the MVP is validated, the application may be extended to additional DMT services, Sinhala/Tamil/English support, approved appointment-system integration, PDF form generation, reminders and human-agent escalation. These items are deliberately deferred so the initial team can complete and demonstrate a focused MVP within one week.

Prototype Reference

Figma - Chatbot with Preview

Note: Final production deployment would require DMT validation of service rules, form versions, privacy requirements and any system integrations.
